

AWS Global & Edge Services – Quick Exam Cheat Sheet

Focus services: Route 53, CloudFront, AWS Wavelength, AWS Outposts, AWS Local Zones, AWS Global Infrastructure, AWS Global Accelerator, and S3 Transfer Acceleration. These notes highlight key exam concepts, use cases, and quick differentiation tips.

	Primary Use Case	Key Exam Points
Routing	Route users to AWS resources using domain names	Supports routing policies: Simple, Weighted, Latency, and Geolocation
Content Delivery	Cache and deliver content globally through edge locations	Reduces latency for static & dynamic content. Uses global edge network
5G networks	Ultra-low latency mobile applications	Used for AR/VR, gaming, IoT requiring 5G edge compute
On-premises	Hybrid cloud workloads requiring local data processing	Runs AWS services in customer data centers with AWS hardware
Major cities	Reduce latency for workloads needing proximity to users	Used for media, gaming, real-time apps needing low latency
Regions, Availability Zones, and Edge Locations	High availability and fault tolerance	Regions contain multiple Availability Zones; edge locations are global
Global Accelerator	Improve availability and performance of global applications	Routes traffic through AWS global network to optimal edge location
S3 Transfer Acceleration	Faster long-distance uploads	Uses CloudFront edge network to accelerate data transfer to S3

Quick Differentiation Tips (Exam Focus)

- CloudFront → CDN for caching content globally.
- Route 53 → DNS service with multiple routing policies.
- Global Accelerator → Improves global app performance using static IPs and AWS network.
- S3 Transfer Acceleration → Speeds up uploads to S3.
- Local Zones → AWS compute closer to major cities.
- Wavelength → Ultra-low latency 5G mobile apps.
- Outposts → AWS hardware installed in your on-premises data center.
